

I contributed to the RoomStudio project by leading and participating in a focused design consultation that helped refine both the visual direction and user experience of the application. During this process, I worked with the team to define a clear design language using keywords such as boxy, sleek, outlined, and neobrutalism, which guided the overall aesthetic of the interface and icons.

I presented three distinct logo and desktop icon directions that aligned with these visual goals and facilitated discussion around branding, including considerations for the application name and identity. In addition, I reviewed a live demo of the application and evaluated how users interact with the current interface.

Based on this analysis, I proposed several usability and feature improvements. These included adding a grid toggle for better visual control, implementing ruler-based snapping for precise alignment, introducing vector-based positioning for line accuracy, and expanding hotkey functionality. I also identified the need for clearer UI elements, such as labeled toolbars and boxed visual groupings, as well as a history system to support undo actions more efficiently.

Overall, my contributions helped bridge visual design and functional usability, ensuring the application is both intuitive for users and consistent with its intended design system.
